EVA FOAM

EVA polyurethane foam is a kind of plastic, more specifically, a copolymer of ethylene and vinyl acetate in an extremely fine closed-cell foam. Available in different densities and sizes that are well-suited to being sewn, EVA polyurethane foam is stronger than polyethylene and has excellent characteristics of elasticity, flexibility, mechanical resistance, abrasion resistance, resistance to low temperatures and to the sun's rays. Widely used in the shoe industry, as well as in marine/nautical settings, it is also ideal for the production of outdoor furniture. Sheets made of this material do not absorb humidity and are resistant to wear, weather and to contact with water, salt and chlorine. Care: the parts in woven EVA polyurethane foam can easily be cleaned with a soft cloth, dampened with water, and pH-neutral liquid soap. However, it is important and strongly recommended that these products be covered with their respective covers when not in use for long periods of time.
