

ANTHRACITE 7005

PVC CORD

PVC, or polyvinylchloride, is a thermoplastic material known for its wide-ranging versatility. Through the process of extrusion, the PVC undergoes permanent plastic deformation, making it possible to manufacture elements with a constant section (will not stretch or kink); as, for example, in the reinforced PVC cord with nylon core used by Flexform in the production of its outdoor furnishings. PVC has good mechanical properties and good resistance to abrasion, wear, aging, the effects of weather and to fungus and bacteria. The material is water-repellent and easy-care. Care: the parts in woven extruded PVC cord can be easily cleaned with a soft cloth, dampened with water, and pH-neutral liquid soap. It is a good idea to protect the product with its cover when not in use for long periods of time.
